/note="vector: pT73D-Pac (Pharmacia) with a modified polyliker; Site_1: Bco Ri; The UI-C2p plubrary is a subtracted library derived from the UI-C2p library, which is a subtracted library derived from the UI-R-C1 library, which is a subtracted library of size in UI-R-C0 library consisted of a mixture of individually tagged normalized libraries constructed from rat placenta, adult lung, brain, liver, kidney, heart, spleen, ovary, muscle, 8, 12 and 18-day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dT track which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-C2p) was constructed as follows: PCR amplified cDNA inserts from UI-R-C1 clones from which 3' ESTS had been derived was used as a driver in a hybridization with the UI-R-C1 library in the form of single-stranded circles. The remaining single-stranded circles and electroporated into DHIOB bacteria (Life Technologies) to generate the UI-R-C2P library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6: 77 c 98 g 91 t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo sapiens

a modified polylinker; Site] Not I: Site_2: Eco R:
gral amounts of plasmid DNA from three normalized
Libraries (fetal lung NbHL19W, testis NHT, and B-cell
NCI_CGAP_GCB1) were mixed, and ss circles were made in
vitro. Following HAP purification, this DNA was used as
tracer in a subtractive hybridization reaction. The driver
was PCR-amplified CDNAs from pools of 5,000 clones made
from the same 3 libraries. The pools consisted of
I.M.A.G.E clones 297480-302087, 682632-687239,
S75408-728711, and 729096-31399. Subtraction by Bento
Scares and M. Fatina Bonaldo.

//tote="Vector: pSPORT; Site_l: NotI; Site_2: Sall: 1st
strand cDNA was prinned with a Not I - oligo(dT)15 primer
double-stranded cDNA was ligated to Sal I adaptors (BRL),
digested with Not I and Cloned into the Not I and Sal I
sites of the pSPORT! vector (BRL). Library was constructed
by Matthew Clark (Lehrach lab: ICRF, London and Max Planck
Institut fuer Molekulare Genetik, Bellin). CDNAs for EST
analysis were selected following oligonucleotide
bybridization fingerprinting of arrayed clones from
cenbryonic shield stage (5.6 h) libraries. Fingerprint
single cDNA from each cluster was chosen for sequencing
In some cases multiple members of the same cluster were
sequenced to assess clustering parameters or single clones
were sequenced additional times to assess quality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Email: zbrafish@watson.wustl.edu

cloned 5' -> 3' into the Hindili -> NotI sites of the
lafmid BA vector. Clone library from B.Soares, Psychiatry
zebrafish late somitogenesis (26 ss), adult liver or embryonic shield stage (5.6 h) libraries. Fingerprint data were used to computationally cluster cDNAs, and a single cDNA from each cluster was chosen for sequencing. In some cases multiple members of the same cluster were sequenced to assess clustering parameters or single clones were sequenced additional times to assess quality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 27.552; Variance 131.690; scale 0.209

Human; stomach cancer. Transmembrane domains and their transmembrane domains and their the preparation of antibodies and ish. To an ovel transmembrane protein to a novel transmembrane protein to a novel transmembrane protein trons alone and a putative The invention provides nucleotide The invention provides nucleotide The invention provides nucleotide and for all transmembrane proteins aning for 18 transmembrane proteins aning such polynucleotides, and tevetors. The polynucleotides can be used and as gene sources for gene therapy proteins encoded by the oDNA. The tection of liquads corresponding to te screening of low mol.wt. medicines.

New isolated human genes - useful for diagnosis and treatment of, e.g. cancers, neurological disorders, immune diseases, developmental production disorders or blood disorders.

Fig. cancers or blood disorders immune diseases, developmental production disorders or blood disorders in man secretal protein, and is cancers or large sequence represents a human secretad protein, and is expressed in activated neutorphils, endothelial cells, T-cells and concerns are expressed in activated neutorphils, endothelial cells, T-cells and concerns of the invention and their corresponding accreted protein or an esser extent in brain and liver.

The DNA sequences of the invention and their corresponding accreted protein or gene therapy. Also pathological conditions or grample or grample or greening the mount of the new polypeptides in a cambe diagnosed by determining the amount of the new polypeptides in a cambe of adamosed by determining the presence of mutations in the DNA sequences. Specific uses are described for each of the DNA sequences and the encoded conclude developing products for the diagnosis or treatment of cancer, tumours, neurological disorders, developmental abnormalities and foetal caficienties, blood disorders, leukaemias, diseases of the immune system (including allergies or asthma), hepatic diseases, autoimmune conjuscing partners.

New dopamine receptor peptide - useful as antipsychotic agent, e.g.

New dopamine receptor peptide - useful as antipsychotic agent, e.g.

PT for treating schizophrenia

Disclosure; column 129-132; 184pp; English.

Proteins W02657-W02730 represent a range of G-protein coupled receptor

CGFN proteins sclienced from CAMP, adenosine, muscarinic acetylcholine,

adrenergic, thrombin, endothelin, bombesin, endocrine, rhodopain, opsin,

codorant, cytomegaloviral and other GPR proteins. The receptor proteins

codorants, for use in G-protein coupled receptor ligand binding assays.

The polypeptide fragments retain biological activity such as binding assays.

CFN ligand or modulating GPR ligand binding to a GPR (see W02747-W02999)

CFN cramples of polypeptide fragments). The polypeptide fragments can

crample to a GPR abnormality e.g. a psychotic disorder such as
Polypeptide fragments). The polypeptide fragments can be used in compositions for treating subjects suffering from a pathology related to a GPR abnormality e.g. a psychotic disorder such as schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mystally (first entry)
H. pylori GHPO 895 protein.

New isolated Helicobacter polynucleotides - used to develop products for the diagnosis, prevention and treatment of Helicobacter infections and gastrointestinal diseases (Claim 8; Page 250-251; 2054pp; English.

This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroindomal diseases associated with these infections, including acute, chronic, and atrophic gastriis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

```
transmembrane protein, useful for regulating cell death

Claim 16; Page 33-35; 45pp; Engilsh.

This sequence is the mouse apoptosis inducing receptor (AIR) of the
Invention. AIR is a Type I transmembrane protein, soluble forms of which
anneation. AIR is a Type I transmembrane protein, soluble forms of which
can be used to regulate cell death in a therapeutic setting. Soluble AIR
can also be used in vitro to block apoptosis or AIR-expressing cells, or
to screen agonists or antagonists of AIR activity. The cytoplasmic domain
of AIR can be used to develop assays for inhibitors of AIR-induced cell
death, which is useful to regulate cell death in a therapeutic setting as
well as in vitro. Agonists of AIR activity can be used to Aill tumour
cells that express AIR, or T cells expressing AIR in autoimmune diseases.

Craimers, then amplified by anchored PCR using C-alpha specific primers, then amplified again using a different C-alpha specific primer. The amplified product was Sacir-restricted, inserted into Bluescript SK+ vector and used to transform E.coli XL7-blue.

Transformants were screened with a C-alpha specific probe and DNA from positive clones was sequenced in the C-slpha region. The sequence designated "IGR a 12" comprises the complete coding region of a gene of the subfamily V shpha 22; this subfamily was previously identified by the partial sequence (113pp) AC9 (Klein, M. H., Chen, N. H., Proc. Natl. Asad. Sci. USA 84:6884, 1987). The peptide encoded to the control of the subfamily value of the control of the contro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleotide sequences and their monoclonal antibodies and oligo:nucleotide primers - encode variable alpha-chain regions of human T-lymphocyte receptors, for studying immune responses and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 MNYSPGLVSLILLLGRIRGDSVTQMEGPVTLSEEAFLTINCTYTATGYPSLF 53

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        wwri; yww.vi.200/ul.

When mammalian vesicle membrane transport protein - and corresp.

DNA, vectors, transformed cells and antibodies, for diagnosis and treatment of neurological disorders, e.g. Parkinson disease

Frample 2; Page 111-112; 181pp; English.

Example 2; Page 111-112; 181pp; English.

This sequence of the tetracypline transporter protein showed a definite homology with the chromaffin granule anine transport protein (GGAT) of rat. The CDNA encoding the chromaffin granule amine transport protein is useful in gene therapy and as a probe for detecting genomic sequences. The transport protein is used for creening cytotoxic compounds implicated in Parkinsons disease, screening cytotoxic compounds implicated in Parkinsons disease, classases associated with activity of neurotoxins or psychiatric diseases associated with activity of neurotoxins or psychiatric activate its action. Antibodies raised against the transport protein as settinity reagents for purification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              4

Peptide fragment of terracycline transporter protein.
Peptide fragment of terracycline transporter protein;
Vesicle membrane transport protein; gene therapy; screening;
Parkinsons disease; neurotoxin; identification; detection;
antibody; probe; chromaffin granule amine transporter protein;
resistance; terracycline.
Bscherichia coli.

CII-3 (W11674) comprises a subunit of complex II of the human mitochondrial electron transport chain. It is the expression product of the CII-3 gene identified in mammalian artificial chromosome MAC-8.2.3, which is contained in the human-hamster hybrid cell line XEWB.2.3 (ATCC CR. 11991). A portion of the CII-3 gene (see also T72461-65) or of CII-3 CDNA (T72466) can be utilised as a unique cloning site and selectable marker in an MAC, allowing the site-specific integration of an exogenous nucleic acid sequence into the MAC. The MAC can be used for stable expression of large fragments of DNA and also for the production of transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human 7-transmendran receptor HNFDY20,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucieotides and polypeptides encoding a novel human 7-transmembrane receptor - useful for diagnosing and treating e.g. cancer, osteoporosis and Parkinson's disease and infections caused by HIV-1 or -2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ciaim 1; Page 18-19; 24pp; English.
This polypeptide comprises HREDY20, a novel human 7-transmembrane of protein coupled receptor that shows about 30.8% identity in 299 amino acid residues with the thrombin receptor. Its amino acid sequence was deduced from an isolated HREDY20 polynuclectide sequence (see V35631). The invention relates to HREDY20 polypeptides and recombinant materials and methods for their production. It also provides methods for using such polypeptides and HREDY20 polypericetides for treatment of infections such as bacterial, fungal, protozoan and particularly HIV-1 or HIV-2
Mammalian artificial chromosome; MAC; selectable marker; CII-3; mitochondrial electron transport chain complex II.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ë
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    62 SLPMAMSICHRGTGIALSAGVSL-FGMS-ALLLPGNFES-YLELVKSLCL 108

This sequence represents the murine protein, designated misha, which may be a mammalian homologue of the Saccharomyces cerevisiae general repressor protein Sin3. The mish protein associates with a Mad be a mammalian homologue of the Saccharomyces cerevisiae general repressor protein Sin3. The mish protein associates with a Mad be polypeptide to form a mish: Mad and complex which binds to a nucleotide sequence comprising CACGTG. Mad is a basic helix-loop-helix (bHiH) zipper protein Which can compete with Myc by forming sequence. Specific DNA-binding heterocomplexes with Max. Mad.Max. contplexes repress, while Myc: Max complexes repress, while Myc: Max complexes repress, while Myc: Max complexes activite, transcription from promoters containing proximal CACGTG binding sites for these proteins. Expression of Mad is closely linked to differentation in at least two distinct call lineages. The switch from Myc: Max to Mad! Max complexes may reflect the repression of transcription of Myc regulated genes by Mad. The DNA, vectors and host contains useful in elucidation of Mad repressor functions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             W10038 standard; Protein; 1253 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The main nucleic acids encoding recombinant polypeptide(s) that associate with Mad polypeptide - are possible homologues of S. cerevisiate general repressor protein Sin3 associate with Mad polypeptide - are possible homologues of S. cerevisiate general repressor protein Sin3.

Example 12: Fig 294-C; 1118p; Engqlish.

This sequence represents the murine protein, designated mSinA9, which may be a mammalian homologue of the Saccharomyces cerevisiate general repressor protein Sin3. The mSin med max complex which binds to a polypeptide to form a mSin:Mad.max complex which binds to a nucleotide sequence comprising GACGTG. Mad is a basic helix-loop-helix conclected by an expectation which can compete with Myc by forming sequence. Secure in the Myc.Max complexes repress will may mad and sequence comprising conference of the secure of the sequence of the sequence complexes activate, transcription from promoters containing closely linked to differentation in at less two distinct call lineages. The switch from Myc.Max to Mad:Max complexes may reflect the repression of transcription of Myc regulated genes by Mad. The DNA, vectors and host cells of the invention are useful for the recombinant production of mSin Squence 1261 AA;

T receptor and gene 8-30-84
C and gene 11, respectively. A full-length clone corresponding to
Gene 11 was isolated from a human placental library. The
main acid sequence deduced from the nucleotide sequence with
previously characterised neurotransmitter receptors suggests that
it is a new member of the G protein-coupled receptor family.
See Q14835 for gene 11.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     >US-09-092-296-15

Patent No. 572118
GENERAL INFORMATION:
APPLICANT: SCHEfiler, Immo E.
TITLE OF INVENTION: Membalian Artificial Chromosomes and
TITLE OF INVENTION: Methods of Using Same
NUMBER OF ENQUENCES: 16
CORRESPONDENCE ADDRESS:
ADDRESSE: Campbell & Flores LLP
STREET: 4470 La Jolla Village Drive, Suite 700
CITY: San Dago
STATE: California
COUNTRY: United States
ZIP: 9212
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC Compatible
OPERATION SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION NUMBER: US/08/741,406
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 83; DB 3; Length 194;

Sequence 4, Application US/08828832
Patent No. 5827711
GENERAL INFORMATION:
APPLICANT: Dal, Freet,
APPLICANT: Shah, Purvi
TILLE OF INVENTION: NOVEL SUCCINATE DEHYDROGENASE SUBUNIT
NUMBER OF SEQUENCES: 4
CORRESPONDENCE ADDRESS:
ADDRESSEE: Incyte Pharmaceuticals, Inc.
STRET: 3174 Porter Drive
CITY: Palo Alto
STATE: CA
COUNTRY: USA
ZIP: 94304
COMPUTER READMALE FORM:
MEDIUM TYPE: Diskette
COMPUTER: EMA Compatible
OPERATING SYSTEM: DOS
SOFTWARE: FastECD for Windows Version 2.0
CURRENT APPLICATION DATA:
APPLICATION NUMBER:
ELING DATE: Herewith
CLASSIFICATION: 435
FRIOR APPLICATION NUMBER:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 6, Application US/08117006
Patent No. 5639652
GENERAL INFORMATION:
APPLICANT: Welnshank, Richard L.
APPLICANT: Branchek, Theresa
APPLICANT: Branchek, Theresa
APPLICANT: BRANCHIG, Paul R.
TITLE OF INVENTION: DNA ENCODING A HUMAN 5-HIIF RECEPTOR AND TITLE OF SEQUENCES: 9

No. 5.04e+01; Matches 17; Conservative 22; Mismatches 32; Indels
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, version #1.25
CURREY APPLICATION DATA:
APPLICATION DATA:
APPLICATION NUMBER: US/08/216,594
FILING DATE:
CLASSIFICATION: 435
ATTORNEY/AGENT INFORMATION:
NAME: White, John P REGISTRATION NUMBER: 1795/39318
REFERENCE/DOCKET NUMBER: 1795/39318
TELECOMMUNICATION INFORMATION:
TELEFAX: 212-977-9550
TELEFAX: 212-64-0525
TELEFAX: 42253 CDOP UI
INFORMATION FOR SEQ ID NO: 6:
SEQUENCE CHARACTERISTICS:
LENGTH: 390 amino acids
TYPE: amino acids
STRANDEDNESS: unknown
TOPOLOGY: linear
MOLECULE TYPE: nuclean
TOPOLOGY: linear
MOLECULE TYPE: Protein
HYPOTHETICAL: NO
ANTI-SENSE: NO
ANTI-SENSE: NO
FRAGMENT TYPE: N-terminal
INMEDIATE SOURCE:
CLONE: 5-HT1DB
SEDUENCE
CLONE: 5-HT1DB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CITY: New YORK
STATE: New YORK

Mean 39.408; Variance 84.670; scale 0.465 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 40.128; Variance 78.050; scale 0.514

MEDLINE; 97189248.

LIN Y.J., BOVETTO S., CARVER J.M., GIORDANO T.;

"CLOINING of the cDNA for the human NADA receptor NR2C subunit and its a "CLOINING of the cDNA for the human NADA receptor nad periphery.";

Brain Res. Mol. Brain Res. 43:57-64(1996).

1. Brain Res. Mol. Brain Res. 43:57-64(1996).

2. INTROLION: NADA RECEPTOR SUBTYPE DO GLUTAMATE-GATED ION CHANNELS POSSESES HIGH CALCIUM PERMANABILITY AND VOLTAGE-DEPENDENT SENSITIVITY TO MAGNESIUM AND IS MEDIATED BY GLYCINE.

2. SUBUNIT: HETERODIMER OF AN EPSILON SUBUNIT MAD A ZETA SUBUNIT.

3. SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

4. TISSUE SPECIFICITY: MAININ IN BRAIN WITH PREDOMINANT EXPRESSION IS IN THE CREBELLUM, ALSO PRESENT IN THE HIPPOCAMPICS, AMYCDALA, CAUDATE NUCLEUS, CORPUS CALLOSUM, SUBTHALAMIC NUCLEI AND THALAMUS.

C. IN THE CERBELLUM, ALSO PRESENT IN THE HIPPOCAMPICS, AMYCDALA, CAUDATE NUCLEUS AND PANCREAS.

CAUDATE NUCLEUS, CORPUS CALLOSUM, SUBTHALAMIC NUCLEI AND THALAMUS.

C. IN THE HEART, SERLETAL MUSCLE AND PANCREAS.
